

Remote Desktop Manager Now Supports High DPI

Devolutions

**THE HIGH DPI WILL BE AVAILABLE
TO ALL IN VERSION 11.5 COMING
OUT SOON!**

Big News! RDM Now Supports High Resolution Display! For years, computer monitors have been increasing in size, for example with **4K resolution** – which would be good news, except that generally speaking, there's only been a minor increase in resolution. As a result, many IT pros have high-pixel density displays that are not optimized by the software they use, especially on Surface Pro 4 and Surface Book.

Well today, I'm thrilled to announce that **Remote Desktop Manager now supports high resolution (DPI) display!**

For the moment, it is only available in the **Beta version of Remote Desktop Manager**, which you can **download [here](#)**. If you would rather wait for the official version, the High DPI will be **available to all in version 11.5** coming out soon!

As you might expect, this improvement is a result of suggestions from our amazing community of IT pros – which would be YOU. We're always listening to your feedback and ideas. Yes, it may take us a bit of time to implement your suggestions, but our talented development team is constantly working hard to make your wishes come true.

So keep your requests coming, and we promise to always do our best for you!
